

FOOD BRIDGE

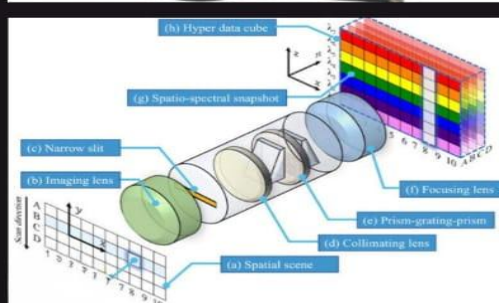

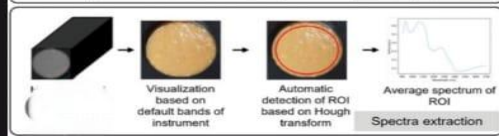

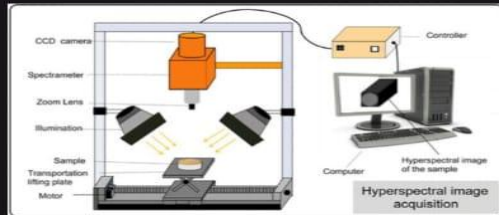

Welcome to the
working function of
food bank

Work function of food bank

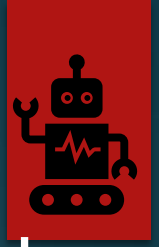

Function instruments in food bridge

Project Overview Aim:

1. The system uses AI/ML for food quality tracking, demand matching, and logistics optimization
2. Reducing food waste and improving food access using an automated system that redistributes surplus food via smart vending machines.
3. Features seamless touch technology for user interaction□□.

HOW AI AND ML USED IN FOOD BANK

- Use of AI to assess surplus food quality in real time and ensure safe redistribution.
- Machine Learning predicts demand hotspots and matches donations to local needs.
- End-to-end digital platform streamlines supply chain partnerships
- IT WILL PROVIDE MORE ACCURETE RESULT PERFECTLY

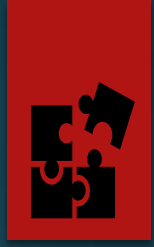

Vending Machine Architecture

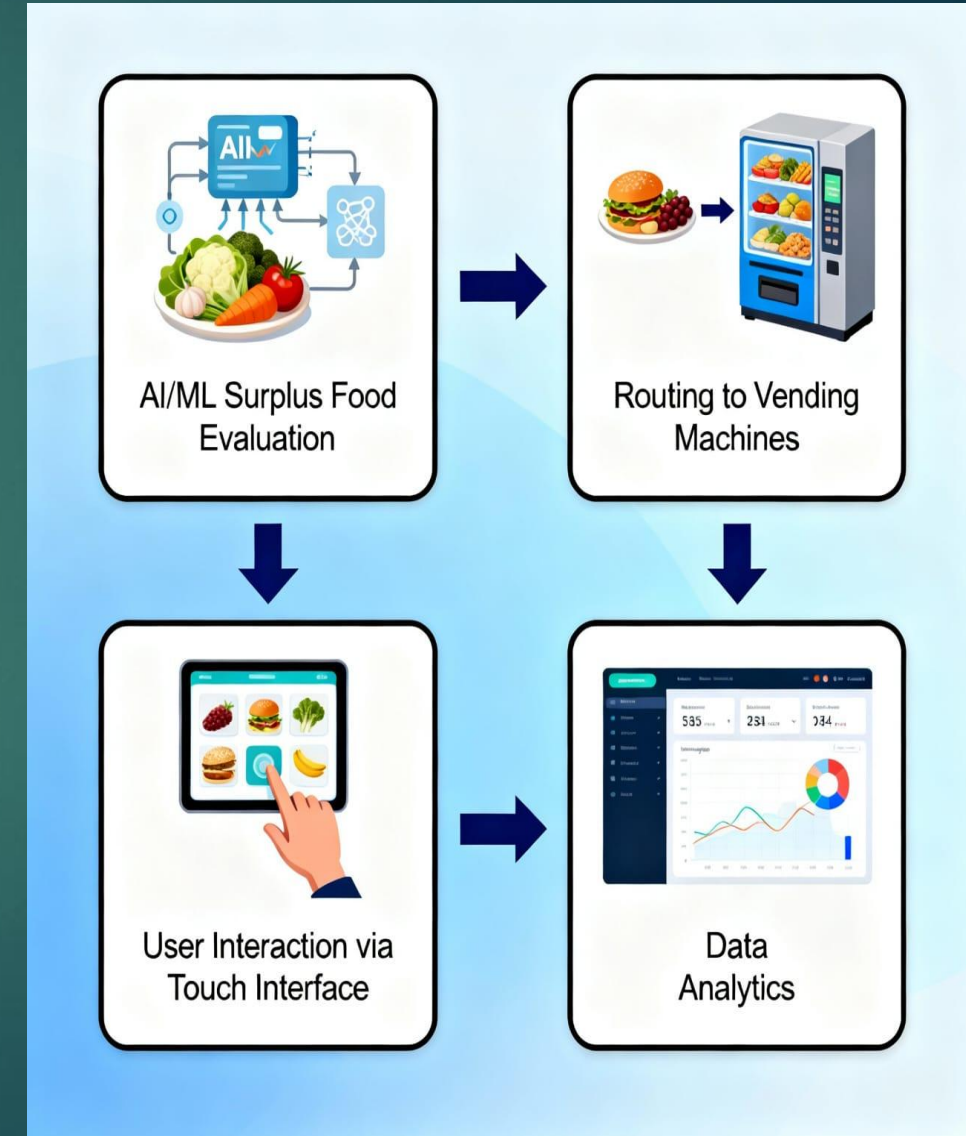

- Components: Sensors, DC motors, controllers (e.g., Raspberry Pi), touch panel, payment interface, cloud database.
- Workflow: User selects product via touchscreen. Machine verifies inventory, payment. DC motor dispenses item; sensors confirm transaction
- Transaction records are stored securely on server/database for analytics□□.

System Workflow Diagram

- Surplus food identified by manufacturers/charities.
- AI platform evaluates quality, demand, and logistics.
- Food routed to vending machine locations based on ML insights.
- End-user interacts via the touch interface to access food items.

SAVE FOOD SAVE LIFE

THANK YOU....
